IP Standard Telecommunications

IP Standard Telecommunications service is dedicated to the users in need of simple telecommunications service with high-quality sound

Service description:

The IP Standard Telecommunications service is dedicated to the users in need of simple telecommunications service with high-quality sound. To implement the service it is possible to use already available Internet access, or for the highest quality, it is possible to establish a data transmission link dedicated to the service.

Range of the service:

The service provides basic functions, necessary to establish a telecommunications link:

- sip standard account
- access to the public telecommunications network
- emergency calls
- caller identification
- waiting calls
- three-party calls
- call transfer
- additional protection from telecommunications abuse

Benefits of the service:

There are additional extensions to the basic functions:

- Selective routing of calls:
 - this service allows to selectively convey calls to a given number/group of numbers
- Limits on outgoing calls:
 - this service allows blockade on calls to specified type of calls (domestic mobile calls, domestic landline calls, international calls, additionally billed calls).
- Music on hold:

- when putting a call on hold music is played instead of a regular ring tone, signalling waiting for the call
- Customer Panel and Account Panel access:
 - due to special panels it is possible to view information on the account, modify service settings (within the possible scope), obtain calls history, check the account balance, update contact data, and change passwords
